### DETAILED ACTION

Claims 2-9 have been canceled. Claims 13 and 14 have been added. Claims 1, 10 and 12 have been amended. Claims 1 and 10-14 are pending and under consideration.

The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 1, 11 and 12 are rejected under 35 U.S.C. 112, first paragraph, as failing to comply with the written description requirement. The claim(s) contains subject matter which was not described in the specification in such a way as to reasonably convey to one skilled in the relevant art that the inventor(s), at the time the application was filed, had possession of the claimed invention. Claims 1, 11 and 12 are method claims reliant on the identity of a genus of secondary plasmacytoid dendritic cell markers present in the blood. The specification describes type 1 interferons and MxA as two such markers. The art recognizes that the MxA protein is induced by type I interferons (Schnorr et al, Journal of Virology, 1993, Vol. 67, pp. 4760-4768). Thus, the MxA protein is produced in response to type I interferons. The art teaches that plasmacytoid dendritic cells (also called , pDC or plasmacytoid monocytes) are the major producers of interferons in the blood (Liu, Human Immunology, 2002, Vol. 63, pp. 1067-1071, see page 1070, first column last sentence). However, the art does not provide other secondary or secreted markers of pDC (Liu, ibid, page 1071, item 5). The genus of secondary markers is highly variant, because said genus encompasses molecules which differ widely in both structure and function from type I interferons or the genes activated by said type 1 interferons. One of skill in the art cannot readily envision other species encompassed within said genus because said species would need to be empirically determined. Thus, the description of type I interferons and a single protein induced by the type I interferons fails to adequately describe the highly variant genus. One of skill in the art would reasonable conclude that applicant was not in possession of the highly variant genus of secondary markers and accordingly was not in possession of the methods dependent upon such a genus.

Art Unit: 1643

Claims 10, 13 and 14 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

All other rejections and objections as set forth or maintained in the previous Office action are withdrawn.
